Q59. Suppose that $\begin{pmatrix} X \\ Y \end{pmatrix}$ has a bivariate density $f = \frac{1}{2}f_1 + \frac{1}{2}f_2$, where f_1 and f_2 are respectively, the densities of bivariate normal distribution $N(\mu_1, \Sigma)$, and $N(\mu_2, \Sigma)$, with $\mu_1 = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$, $\mu_2 = \begin{pmatrix} -1 \\ -1 \end{pmatrix}$ and $\Sigma = \mathbb{I}_2$, the 2×2 identity matrix. Then which of the following is correct ?

- a) X and Y are positively correlated
- b) X and Y are negatively correlated
- c) X and Y are uncorrelated but they are not independent
- d) X and Y are independent

Answer:

To check the correlation between X and Y we can calculate the covariance of X and Y . If the value of covariance is $+ve$ then X and Y are positively correlated, if the value is $-ve$ then X and Y are negatively correlated and if the value is 0 then X and Y are independent.

For a bivariate, covariance is defined as

$$\text{cov}(X, Y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} (x - \mu_x)(y - \mu_y) f(x, y) dx dy \quad (1)$$

The bivariate normal distribution is defined as

$$f(\underline{X}) = \left(2\pi \sqrt{|\Sigma|} \right)^{-1} e^{-\frac{1}{2}[(\underline{X} - \underline{\mu})^T \Sigma^{-1}(\underline{X} - \underline{\mu})]} \quad (2)$$

where

$$\underline{X} = \begin{pmatrix} X \\ Y \end{pmatrix}, \Sigma = \begin{pmatrix} \text{Var}[X] & \text{Cov}(X, Y) \\ \text{Cov}(X, Y) & \text{Var}[Y] \end{pmatrix} = \begin{pmatrix} \sigma_X^2 & \rho\sigma_X\sigma_Y \\ \rho\sigma_X\sigma_Y & \sigma_Y^2 \end{pmatrix}$$

ρ is the correlation coefficient.

The mean can be obtained as such

$$\mathbb{E} \begin{bmatrix} X \\ Y \end{bmatrix} = \frac{1}{2}\mu_1 + \frac{1}{2}\mu_2 = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

and

$$\Sigma = \mathbb{I}_2$$

so,

$$|\Sigma| = 1$$

,

$$\Sigma^{-1} = \mathbb{I}_2$$

Now,

$$\begin{aligned} Cov(X, Y) &= \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xy \left(\frac{1}{2}f_1 + \frac{1}{2}f_2 \right) dx dy \\ &= \frac{1}{2} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xy f_1 dx dy + \frac{1}{2} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xy f_2 dx dy \end{aligned} \quad (3)$$

consider,

$$\begin{aligned} I_1 &= \frac{1}{2} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xy f_1 dx dy \\ &= \frac{1}{2} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xy \frac{1}{2\pi} e^{-\frac{1}{2}[(X-\underline{\mu}_1)^T(X-\underline{\mu}_1)]} dx dy \\ &= \frac{1}{4\pi} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xy e^{-\frac{1}{2}(\|X\|^2 + \|\underline{\mu}_1\|^2 - 2X^T \underline{\mu}_1)} dx dy \\ &= \frac{1}{4\pi} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xy e^{-\frac{1}{2}(x^2 + y^2 + 2 - 2x - 2y)} dx dy \\ &= \frac{1}{4\pi} \int_{-\infty}^{\infty} x e^{-\frac{1}{2}(x-1)^2} dx \int_{-\infty}^{\infty} y e^{-\frac{1}{2}(y-1)^2} dy \end{aligned} \quad (4)$$

let,

$$I_2 = \int_{-\infty}^{\infty} x e^{-\frac{1}{2}(x-1)^2}$$

observe,

$$\begin{aligned}
 \int_{-\infty}^{\infty} e^{-\frac{1}{2}(x-1)^2} dx - I_2 &= \int_{-\infty}^{\infty} (1-x)e^{-\frac{1}{2}(x-1)^2} dx \\
 &= \int_{-\infty}^{\infty} \frac{d}{dx} \left(e^{-\frac{1}{2}(x-1)^2} \right) dx \\
 &= \left[e^{-\frac{1}{2}(x-1)^2} \right]_{-\infty}^{\infty} \\
 &= 0
 \end{aligned} \tag{5}$$

So from (5),

$$\begin{aligned}
 I_2 &= \int_{-\infty}^{\infty} e^{-\frac{1}{2}(x-1)^2} dx \\
 &= \int_{-\infty}^{\infty} e^{-\frac{1}{2}u^2} du \quad (u = x - 1)
 \end{aligned}$$

now,

$$\begin{aligned}
 I_2^2 &= \int_{-\infty}^{\infty} e^{-\frac{1}{2}u^2} du \int_{-\infty}^{\infty} e^{-\frac{1}{2}v^2} dv \quad (v \text{ is a dummy variable}) \\
 &= \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} e^{-\frac{1}{2}(u^2+v^2)} dudv \\
 &= \int_0^{\infty} \int_0^{2\pi} e^{-\frac{1}{2}r^2} r dr d\theta \quad (\text{changing to polar co-ordinates}) \\
 &= 2\pi
 \end{aligned} \tag{6}$$

So from (6),

$$I_2 = \sqrt{(2\pi)}$$

Now going back to (4),

$$\begin{aligned}
 I_1 &= \frac{1}{4\pi} * \sqrt{(2\pi)} * \sqrt{(2\pi)} \quad (\text{integral over } y \text{ is exactly same}) \\
 &= \frac{1}{2}
 \end{aligned}$$

Now from (3),

$$\begin{aligned}
 Cov(X, Y) &= \frac{1}{2} + \frac{1}{2} \quad (\text{second part is similar}) \\
 &= 1
 \end{aligned}$$

Since $Cov(X, Y)$ is +ve, X and Y are positively correlated. (Ans.)
